

Practical -5

Working with Forms in HTML5

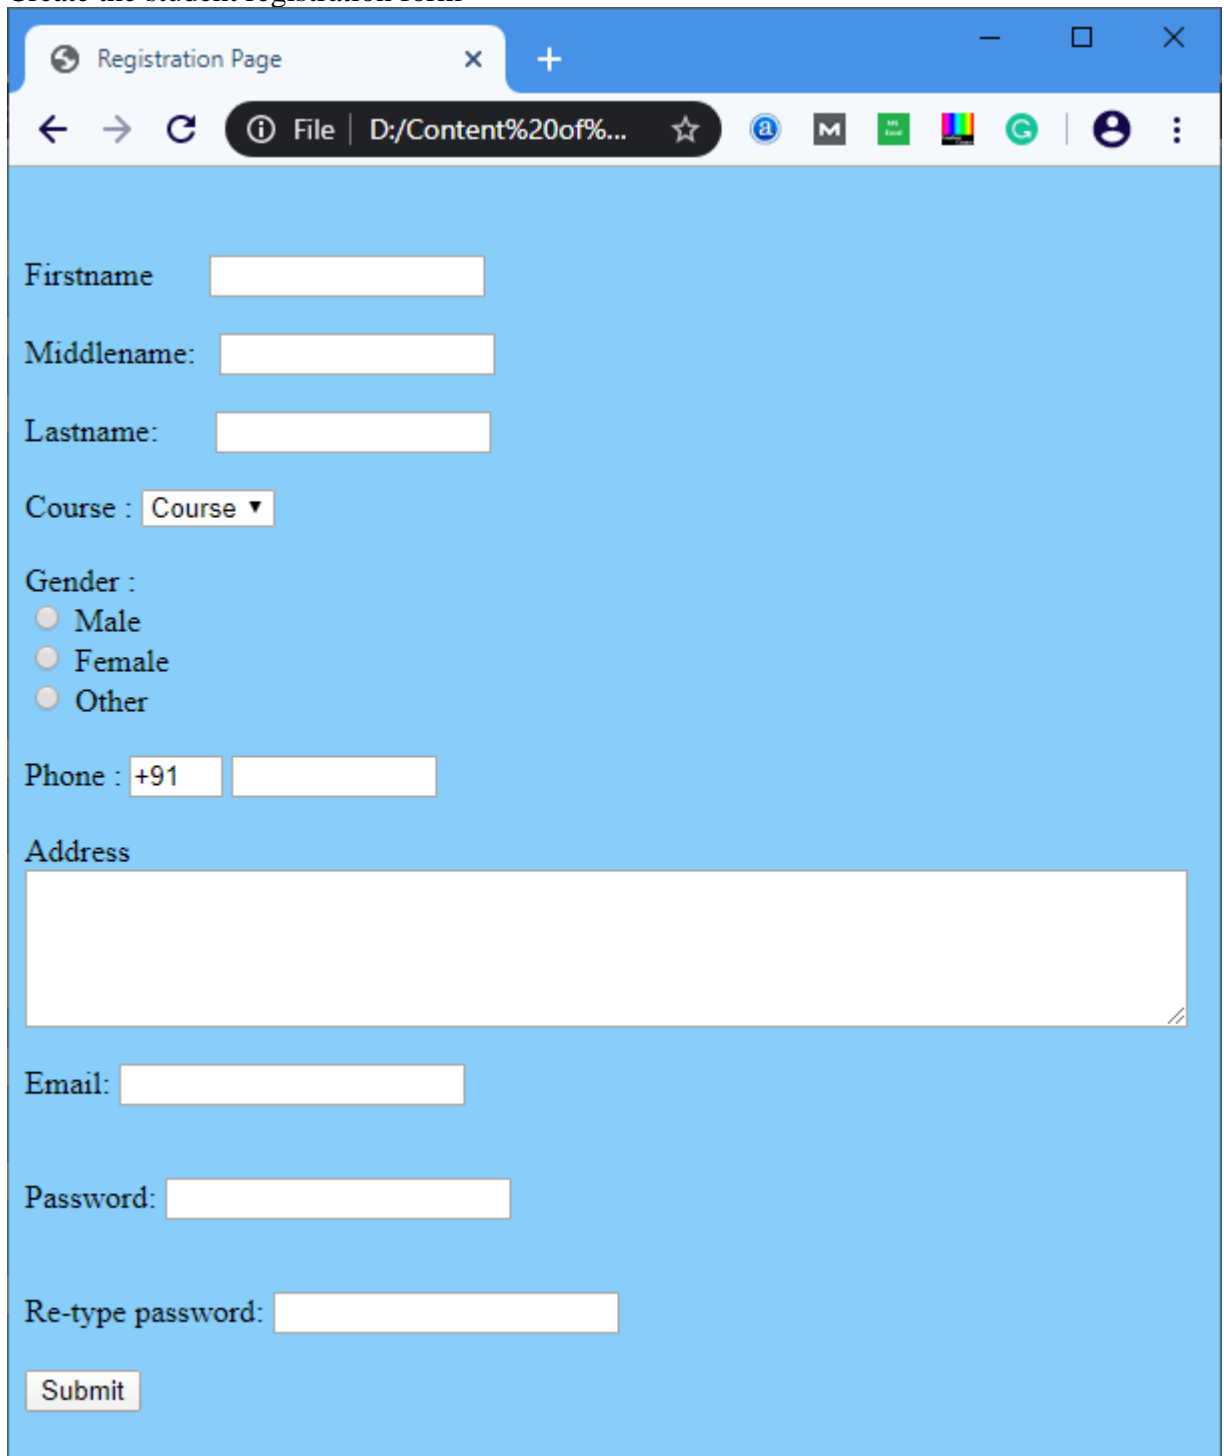

1. Create an HTML5 Form which demonstrates following tags.
 - a. Form Tags
 - b. Input Tag Types
 - c. Button Tags
 - d. Multiple-Choice Tags
 - e. Select Tag
 - f. Option Tag
 - g. Optgroup Tag
 - h. Textarea and Label Tags
2. Create Registration Form shown as below

Company Registration Form

Email Address:

Password:

3. Create the student registration form

The image shows a web browser window with a single tab titled "Registration Page". The address bar displays "File | D:/Content%20of%..." with a star icon for bookmarks. The browser's toolbar includes navigation buttons (back, forward, refresh), a search bar, and several extension icons (a, M, MS Edge, a color bar, G, and a user profile icon). The page content is a registration form on a light blue background. The form includes the following fields and controls:

- Firstname:** A single-line text input field.
- Middlename:** A single-line text input field.
- Lastname:** A single-line text input field.
- Course:** A dropdown menu currently showing "Course" with a downward arrow.
- Gender:** Three radio button options: "Male", "Female", and "Other".
- Phone:** A text input field containing "+91" followed by an empty single-line text input field.
- Address:** A large, empty multi-line text area.
- Email:** A single-line text input field.
- Password:** A single-line text input field.
- Re-type password:** A single-line text input field.
- Submit:** A rectangular button with the text "Submit".

Creating a form Example

```

<!DOCTYPE HTML >
<HTML>
<HEAD>
  <TITLE>Form</TITLE>
</HEAD>
<BODY>
  <!-- starting of form -->
  <FORM>
    Username: <input type="text" name="user"/><br/>
    Password: <input type="password" name = "pass"/><br/>
    <input type="submit">
  </FORM>
  <!--ending of form -->
</BODY>
</HTML>

```

Input tags

■ Text field

- Example: <input type="text" name="inputname"/>

■ Password field

- Example: <input type="password" name="inputname"/>

■ Radio buttons

- Example:

<input type="radio" name="gender"> Male

<input type="radio" name="gender"> Female

☒ Male ☐ Female

■ Check boxes

- Example:

<input type="checkbox" name="Roll1"> Roll No 1

<input type="checkbox" name="Roll2"> Roll No 2

<input type="checkbox" name="Roll3"> Roll No 3

☐ Roll No 1
☐ Roll No 2
☐ Roll No 3

Input tags (cont.)

■ Dropdown list

- `<select>` tag is used to create a drop-down list in HTML.
- `<option>` tags inside the `<select>` tag define the available options in the list.
- Example:

```
<select>  
  <option value="1">Rajkot</option>  
  <option value="2">Ahemdabad</option>  
  <option value="3">Surat</option>  
</select>
```

- Example (multiple select):

```
<select multiple="multiple">  
  <option value="1">Rajkot</option>  
  <option value="2">Ahemdabad</option>  
  <option value="3">Surat</option>  
</select>
```

Input tags (cont.)

■ Text area

- `<textarea>` tag defines a multi-line text input control.

- Example :

```
<textarea rows="8" cols="30">
```

Darshan Institute of Engineering & Technology is a leading institute

```
</textarea>
```

■ Submit Button

- Submit button is used to submit the data to the form action url.

- Example :

```
<input type="submit" value="Add City">
```

Add City

Tag	Description
<code><form></code>	<p>The <code><form></code> tag is used to create an HTML form for user input. The <code><form></code> element can contain one or more of the following form elements:</p> <ul style="list-style-type: none"> • <code><input></code> • <code><textarea></code> • <code><button></code> • <code><select></code> • <code><option></code> • <code><optgroup></code> • <code><fieldset></code> • <code><label></code> • <code><output></code>

Attributes are : accept-charset, action, autocomplete, enctype, method, name,

nonvalidate, target

enctype : Specifies how the form-data should be encoded when submitting it to the server (only for method="post") (application/x-www-form-urlencoded
multipart/form-data, text/plain)

action : Specifies where to send the form-data when a form is submitted (URL)

method : Specifies the HTTP method to use when sending form-data (get, post)

<input>

The **<input>** tag specifies an input field where the user can enter data. The **<input>** element is the most important form element. The **<input>** element can be displayed in several ways, depending on the type attribute.

The different input types are as follows:

- `<input type="button">`
- `<input type="checkbox">`
- `<input type="color">`
- `<input type="date">`
- `<input type="datetime-local">`
- `<input type="email">`
- `<input type="file">`
- `<input type="hidden">`
- `<input type="image">`
- `<input type="month">`
- `<input type="number">`
- `<input type="password">`
- `<input type="radio">`
- `<input type="range">`
- `<input type="reset">`
- `<input type="search">`
- `<input type="submit">`
- `<input type="tel">`
- `<input type="text">` (default value)
- `<input type="time">`
- `<input type="url">`
- `<input type="week">`

attributes are : alt, autocomplete, autofocus, checked, disabled, formaction, formmethod, max, maxlength, min, minlength, multiple, readonly, size, required, type, value

<button>

The **<button>** tag defines a clickable button. Inside a **<button>** element you can put text (and tags like **<i>**, ****, ****, **
, **, etc.). That is not

possible with a button created with the `<input>` element!

Tip: Always specify the `type` attribute for a `<button>` element, to tell browsers what type of button it is.

Attributes are : `autofocus`, `disable`, `form`, `formaction`, `formenctype`, `formmethod`, `formvalidate`, `formtarget`, `name`, `type`, `value`

`<select>`

multiple-choice
element

The `<select>` element is used to create a drop-down list. The `<select>` element is most often used in a form, to collect user input. The `name` attribute is needed to reference the form data after the form is submitted (if you omit the `name` attribute, no data from the drop-down list will be submitted). The `id` attribute is needed to associate the drop-down list with a label. The `<option>` tags inside the `<select>` element define the available options in the drop-down list.

Attributes are : `disabled`, `name`, `size`, `autofocus`, `form`, `multiple`

`<option>`

The `<option>` tag defines an option in a select list. `<option>` elements go inside a `<select>`, `<optgroup>`, or `<datalist>` element.

Note: The `<option>` tag can be used without any attributes, but you usually need the **value** attribute, which indicates what is sent to the server on form submission.

Attributes are : `label`, `disabled`, `selected`, `value`

`<optgroup>`

The `<optgroup>` tag is used to group related options in a `<select>` element (drop-down list). If you have a long list of options, groups of related options are easier to handle for a user.

Attributes are : `label`, `disabled`.

`<textarea>`

The `<textarea>` tag defines a multi-line text input control. The `<textarea>` element is often used in a form, to collect user inputs like comments or reviews. A text area can hold an unlimited number of characters, and the text renders in a fixed-width font (usually Courier). The size of a text area is specified by the `<cols>` and `<rows>` attributes (or with CSS). The `name` attribute is needed to reference the form data after the form is submitted (if you omit the `name` attribute, no data from the text area will be submitted). The `id` attribute is needed to associate the text area with a label.

Attributes are : `cols`, `rows`, `disabled`, `name`, `readonly`, `accesskey`, `autofocus`, `dirname`, `maxlength`, `placeholder`, `required`, `wrap`.

`<label>`

The `<label>` tag defines a label for several elements:

- `<input type="checkbox">`
- `<input type="color">`
- `<input type="date">`

- `<input type="datetime-local">`
- `<input type="email">`
- `<input type="file">`
- `<input type="month">`
- `<input type="number">`
- `<input type="password">`
- `<input type="radio">`
- `<input type="range">`
- `<input type="search">`
- `<input type="tel">`
- `<input type="text">`
- `<input type="time">`
- `<input type="url">`
- `<input type="week">`
- `<meter>`
- `<progress>`
- `<select>`
- `<textarea>`

Proper use of labels with the elements above will benefit:

- Screen reader users (will read out loud the label, when the user is focused on the element)
- Users who have difficulty clicking on very small regions (such as checkboxes) - because when a user clicks the text within the `<label>` element, it toggles the input (this increases the hit area)

attributes are : for, form
